SICS Technical Report T2016:02

April 22, 2016

Abstract: For all 8192 combinations of Allen's 13 relations between one task with origin o_i and fixed length ℓ_i and another task with origin o_j and fixed length ℓ_j , we give a formula $F(o_j, \overline{o_j}, \ell_i, \ell_j)$, where $\overline{o_j}$ and $\overline{o_j}$ respectively denote the earliest and the latest origin of task j , evaluating to a set of integers which are infeasible for o_i for the given combination. Such forbidden regions are useful e.g. in a range-consistency maintaining propagator for an Allen constraint in finite domain constraint programming.

Keywords: global constraint, Allen relation.
